Whether we are looking at anti-cancer drugs which are large molecules or small molecules or peptides, it is essential for clinicians today to monitor the patient to set the correct monitoring dosage to ensure better compliances and efficacy.

As these are bio-drugs, there are also in cases, the effect of immunogenicity. This could be in some cases be fatal.

Hence it is essential to monitor the dosage regimen and immunogenicity for patients on these drugs.

KRISHGEN offers kits in an easy to use ELISA format, which are CE Marked and well validated. These standards used in these kits have been calibrated against the innovator original drug to ensure a high degree of accuracy.

With our assay kits being used by leading pharmaceutical companies and clinical trial companies, it is easy for us to offer the confidence on the quality of our kits.

We have over the past 8 years worked with leading companies to develop assays and our kits have been used as part of the data generated for regulatory submissions.

Our kits can be used for serum or plasma and offer a very high degree of sensitivity.

We are the only company worldwide offering the widest assay kits for insulin analog or GLP1 agonist drugs monitoring ...
