## HOST CELL PROTEIN DETECTION ASSAYS THAT WORK FOR YOU

Enzyme-linked immunosorbent assays (ELISAs) have historically been among the most effective and widely adopted assays for use in detection and quantification of low analyte concentrations. The technology is selective, sensitive and versatile.

KRISHGEN has developed ELISA kits for HCP detection for use in biologics manufacturing offering high sensitivity and specificity with very competitive prices.

This offers advantages to biosimilar manufacturers under pressure to compete on costs.

These kits are comparable to alternate products commercially available in the market .

High sensitivity, specificity with linearity and high recoveries are the hall mark of these assay kits.

Host cell protein populations are measured using multianalyte enzyme-linked immunosorbent assays (ELISAs) with polyclonal antibodies. The HCP values are expressed in units of ng/mL (ng HCP). These values reflect the degree of specific immuno-reactivity because they are a measure of the epitope population in a representative sample.

KRISHGEN assay kits are certified by our Gold Quality Ring. These assay kits are well validated for immunoassay parameters.
